Abstract

CampusFix is an adaptive campus issue tracking and resolution system designed to provide a simple, centralized, and efficient platform for reporting and managing common problems faced by students and staff within a college campus. Issues such as classroom equipment failures, laboratory problems, Wi-Fi connectivity issues, hostel maintenance, electrical problems, and cleanliness-related complaints are often communicated through informal channels, which can make it difficult to track their progress and ensure timely resolution. CampusFix aims to address this problem by providing a structured digital platform where users can report issues and monitor their status until they are resolved.

The system will provide separate functionalities for students and administrators. Students can register and log in to the platform, submit an issue by providing its title, category, description, priority, and other relevant details, and view the current status of their reported issues. Administrators can access a centralized dashboard to view all reported issues, categorize and prioritize them, assign appropriate actions, and update their status from Pending to In Progress and finally to Resolved. The dashboard can also provide basic statistics to identify frequently reported issue categories and the overall resolution status.

The project will follow Agile and Scrum principles to support iterative development, continuous feedback, task management, and collaboration between the two team members. User stories, sprint planning, backlog management, story points, and task tracking will be maintained using an Agile project management tool. Git and GitHub will be used for version control and collaborative development, while GitHub Actions will be used to implement a basic CI/CD pipeline for automated building and testing of the application.

The proposed system is intended to be simple, scalable, and practical while demonstrating the major concepts of Adaptive Software Engineering, including Agile development, collaborative version control, CI/CD, containerization, security operations, deployment, and monitoring.
